                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1, A

/note="Weetor: pDONR201; In the context of the EU-funded project REGIA (QLG-CT11999-00876, coordinator Javier Paz-Ares), a set of transcription factor ORFs was generated. The ORFs were produced in a decentralized way in the labs of the participants Most-of the ORPs were generated by RT-PCR using CDNA from various A. thaliana tissues as a template. Initially, it was planned to use yeast recombination to move the ORFs from the cloning vectors into target constructs. For this reason, a number of the clones contain 'REGIA tags' (RG_tag1: 5pr-AATTCCAGCTCACAC-3pr; RG_tag2: 5pr-AATTCCAGCTCACC-3pr; RG_tag2: 5pr-AATTCCAGCTCACC-3pr; RG_tag2: 5pr-AATTCCAGCTCACC-3pr; RG_tag2: 6pr-AATTCCAGCTCACC-3pr; RG_tag2: 6pr-AATTCCAGCTCACTC-3pr; RG_tag2: 6pr-AATTCCAGCTCACTC-3pr; RG_tag2: 6pr-AATTCCAGCTCACTC-3pr; RG_tag2: 6pr-AATTCCAGCTCACTC-3pr; RG_tag2: 6pr-AATTCCGGGAATCCCGGGAATC-3pr; RG_tag2: 6pr-AATTCCGGGAATCCCGGGAATC-3pr; RG_tag2: 6pr-AATTCCGGGAATCCG-3pr; RG_tag2: 6pr-AATTCCGGGAATCG-3pr; RG_tag2: 6pr-AATTCGGGAATCG-3pr; RG_tag2: 6pr-AATTCGGGAATCGGGAATCGGGAATCGGGAATCGGGAATCGGGAATCGGGAATCGGGAATCGGGGAATCGGGGAATCGGGGAATCGGGGAATCGGGGAATCGGGGAATCGGGGAATCGGGGAATCGGGGAATCGGGGAATCGGGGAATCGGGGAATCGGG

Data analysis performed in the frame of REGULATORS (Exploiting)

Inter-species conservation in promoter sequences to identify

regulators of reproductive development and physiological

performance), a Trilateral Co-Operation in Plant Genomics between

Spain (MCYT), France (GENOPLANTE) and Germany (GABI) coordinated by

G. Coupland (Coopland-ad-mpiz-koeln.mpg.de). Authors: Vincent

Thareau (IBP-Orsay UMR&618 CNRS-UBS, thareau-ad-ibp.u-psud.fr) and

Alain Lecharny (URCV-Evry UMR INRA-CNRS-UBVE).

Definition of the terms used to describe the quality of the clone:

The about 2250 sequences from the clone collection were sorted

according to clones and clustered. If more than one contig was

formed, the clone was designated 'Contamination'. The contigs and

singletons were blasted against CDS plus pseudogenes from the

TIGRV5 annotation, and the resulting AGI code is presented if more

than 90 percent identity was found. The sequences were also blasted

against all TIGRV5 introns, and matches longer than 50 pp with 95

percent identity are reported as 'intron found'. The remaining

terms (for SeqAnalysis describe the outcome of the evaluation of the

CDS detected after pairwise alignment with CDS plus pseudogenes

from the TIGRV5 annotation file. The sequences or contigs for which

a full CDS with or without STOP codon was detected, a BLASTP

against all TIGRV5 protein sequence; partial good: better

than 95 percent identity; full good: better than 95 percent identity

over more than 95 percent of the sequence; partial good: better

than 95 percent identity over less than 95

percent of the sequence; no similarity; no hit from BLASTP, note

that the collection contains a few clones for which sequencing was not an encent of the sequences of a partial substitution of a partial substitution of a partial substitution of a partial substitution of a parti

// F2, F3, and F4 lines of Aquilegia Formeax A. Pubescens
were grown from seed in greenhouses at UC Santa Barbara.
From these plants three sets of tissue were collected: 1)
Small flower buds (*10 mm) and very young inflorescences
(71 & 29% by weight respectively), 2) Medium (7-20 mm) and
large (at or near anthesis) flower buds (65 & 35% by
weight respectively) and 3) Shoot apical meristenms. A
fourth set of tissue was collected from plants of A.
formosa. These plants were grown from seed in sand and at
approximately I month root tissue and leaf tissue of
various developmental stages were collected (84 & 16% by
weight respectively). Total RNA was extracted from each
set of tissue and pooled in the following proportions:
1.5X from sets 1 & 2, 1X from sets 3 & 4. From the pooled
total RNA, mRNA was extracted and enriched for full-length
messages and then normalized with proprietary methods by

/note=_Wector: pBluescript SK -; Site 1: BcoRI; Site_2:
XhoI; cDNA was prepared from polyA+ enriched RNA. The cDNA
was directionally ligated into the Unizap XR vector from
Stratagene and packaged using Gigapack III Gold packaging
extracts. Plasmids containing cDNA inserts were excised
from the recombinant lambda-Zap phage using Ex-assist
helper phage and propagated in XLOLR cells."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FEATURES
```

formosa. These plants were grown from seed in sand and at approximately 1 month root tissue and leaf tissue of various developmental stages were collected (84 & 16% by weight respectively). Total RNA was extracted from each set of tissue and pooled in the following proportions: 1.5% from sets 1 & 2, 1% from sets 3 & 4. From the pooled total RNA, mRNA was extracted and enriched for full-length messages and then normalized with proprietary methods by

P2, P3, and F4 lines of Aquilegia formosa X As pubescens were grown from seed in greenhouses at UC Santa Barbara.
Prom these plants three sets of tissue were collected: 1)
Small flower buds (*10 mm) and very young inflorescences
/la & 29% by weight respectively), 2) Medium (7-20 mm) and large (at or near anthesis) flower buds (65 & 35% by weight respectively) and 3) Shoot apical meristems. A fourth set of tissue was collected from plants of A. formosa. These plants were grown from seed in sand and at approximately 1 month root tissue and leaf tissue of various developmental stages were collected (84 & 16% by weight respectively). Total RNA was extracted from each set of tissue and pooled in the following proportions:
1.5% from sets 1 & 2, 1% from sets 3 & 4. From the pooled total RNA, mRNA was extracted and enriched for full-length messages and then normalized with proprietary methods by traiting the set of the pooled to the proprietary methods by traiting the propriet of the pr

/note="Vector: Lambda Zap; Medicago truncatula plants were
infested with 300 spotted-aphids each. Tissue samples were
collected by harvesting the entire shoots from 13 plants
after 12, 24, 48, 72 and 96 hours of infestation. Total
RNA was extracted from each sampling time and equal
amounts of total RNA were pooled together for mRNA
purification for CDNA library construction. The CDNA was
directionally ligated into the Uni-Zap XR vector
(Stratagene) and packaged using the Gigapack III Gold
packaging extracts. Phagemids containing CDNA inserts were
using ExAssist helper phage and the E. coli strain
XLI-Blue MRR' (Stratagene). Excised plasmids were plated
using SOLR cells."
